

# HOW BIG (VET) PHARMA HAS BEEN DUPING YOU ON 1-YEAR AND 3-YEAR RABIES VACCINES

A revelation you can act wisely on

WILL FALCONER, DVM 

A WINK AND A NOD

## The truth comes to light

THE REALITY

## Two identical lots of vaccine...

...ONE STUDIED FOR 1 YEAR AND THE IDENTICAL ONE, GIVEN A DIFFERENT LOT NUMBER, STUDIED FOR 3 YEARS.

THE PRACTICAL

- You needn't EVER get a one year rabies vaccine. Why would you?
- If they both "last" for 3 years (likely much, much longer), you don't want to be hearing, "She's DUE for MORE" in a year.
- Can you see the marketing potential, though? "She only had a one year shot, so we need to give her another now to keep her protected."
- Cha ching!

# THE BACKSTORY

## Profits before pets

Is this for real?

"I worked for the vaccine industry for 20 years studying their products before they went to the vet market," he said. "The one-year and three-year rabies vaccines are identical."

He was none other than Dr. Ronald Schultz, well known veterinary immunologist and Ph.D. from U. of Wisconsin.

And the conversation took place in 1993, just after I'd graduated from my homeopathic vet training and was looking sidelong at a lot of what my conventional colleagues were up to.

The biggest problem homeopathic vets were noticing for decades even then, was vaccine injury. Long-lasting chronic diseases that ruined lives and made curing our patients doubly difficult.

What I learned back then was recently corroborated by a research paper from Kansas State, the home of all rabies titer testing. Yep: the same stuff in both lots!

**DR. WILL FALCONER**  
DVM 1980, Homeopathic Vet since 1993

# THE TAKE AWAY FOR YOU

**If you choose to vaccinate for rabies, INSIST on the 3 year vaccine!**

Both vaccine lots, having the same stuff in the vials, confer the same long lasting immunity. How long? Latest data suggest 5-7 or more years.

But: if you vaccinate for rabies, how soon do you want to hear, "Sadie's rabies vaccination is due. Make an appointment and come on in!"

"I love bringing my dog in for shots," said no pet owner, ever.

Especially if they've been the victim of the growing epidemic of long-lasting chronic conditions like The Itch.

That's allergies at work, and from those wise pet owners and vets who are keeping count, they typically show up about a month after a vaccine event. Itchy skin and/or ears are the #1 and #2 reasons dogs see vets. We have data on this, for over 15 years now!

## IF/THEN STATEMENT TIME

**If you choose to vaccinate for rabies...**

...THEN you'll want to do that as \*infrequently\* as you possibly can.

The immunity to viruses lasts for many years, maybe even life. That's what Dr. Schultz and other immunologists know. And hey, they don't sell vaccines, right? Wink, wink. You with me here?

Each oncoming vaccine carries more risk of allergies or worse, and probably fails to stimulate a "booster effect," according to main stream vet immunologists.

So, that's where a three-year vaccine will keep you out of harm's way longer.

# WANT TO LEARN A BUNCH MORE ABOUT RABIES AND SEE IF YOU EVEN NEED A RABIES SHOT?

Be sure you don't miss my upcoming free training you just signed up for! If you're not there live, well, you'll be missing something special that no replay will include. Mark your calendars, tell your phone to remind you, and watch your inbox. Be there or Be Square!

**WANT MORE? RABIES AND YOUR SENIORS: NO!**
